

# Understanding Highcharts

To get to grasp with how Highcharts work it is important to understand the various parts or concepts of a chart.

Below is an image and a description of the main concepts in a chart.

## Title

Is the text that will be presented at the top of a chart.

See Title and subtitle for more information.

## Series

Is one or more series of data presented on a chart.

See Series for more information.

## Tooltip

When hovering over a series or a point on the chart you can get a tooltip that describes the values on that particular part of the chart.

See Tooltip for more information.

## Legend

The legend show the data series in the graph and allows for enabling and disabling one or more series.

See Legend for more information.

## Axes

The x and y-axis of the chart, can also use multiple axes for different dataseries. Most chart types, like the typical cartesian types line and column, have axes. Polar charts have an X axis that spans around the perimeter of the chart, and even gauges have a single value axis. Pie charts don't have axes.

See [Axes](#) for more information.
